

ABSTRACT OF THE DISCLOSURE

An application implemented on a server in a network of storage servers can be provided to manage the data replication relationships implemented between the storage servers of the network. In one embodiment, this server can be designated the manager server, and can include a network adapter to connect the manager server to a network, the network including a plurality of storage servers, the plurality of storage servers implementing a plurality of data replication relationships, and a storage facility to contain a data structure representing the plurality of data replication relationships to enable a user to centrally manage the plurality of data replication relationships.
